

Guide: Sådan opsætter du en "Splash-Screen"

Når du har lavet alle dine "screens" inkl. en splash-screen er det vigtigt at man husker at aktivere splash-screen - ellers vil appen bare køre uden at vise den.

1. Gå ind i appens kontrolpanel:

Account | Applications | BurgerogCO3

- App Icon
- Core Properties
- Layout / Tabs
- Global Themes**
- Context Menus
- Screens / Actions
- Logins / Users
- Files / Media
- Configuration Data
- Publish Changes ●
- App Usage Map
- Push Notifications

Download iOS or Android Project

Permanently Delete App

It's best to design and build your app with the iOS Simulator Running. Running the simulator while you make changes on the control panel allows you to see the changes in real-time. Use the refresh button (see graphic) on your app's home screen while you're designing the app.

Themes allow you to make global changes to your app's look, feel, and layout. Any screen can override the global theme to account for exceptions and small design details.

Home Screens are used as anchors to core content and navigation structures. If your application uses a tabbed layout, each tab is configured with an icon, a title, a screen to use as its home screen.

Menus and Screens make up the bulk of your app. Most of the work you do designing your app will be related to creating and connecting screens. Most applications use a Menu as the home screen. Tapping items on the home screen menu usually loads additional menus and content.

About Version, Modified and Published

If the Modified and Published values don't match, a red dot will show next to the **publish changes** option. Update the version when you submit updates to the App Store or Market.

2. Vælg "Global Themes"

1 - 1 of 1

Themes allow you to make global changes to all screens in the app. You can create as many themes as you want. Experiment by creating new themes then clicking the "activate" link. Only one theme can be active at a time and you can change the active theme anytime.

Override the theme by making adjustments to the advanced properties on individual screens. Example: You may want all the screen in the app to share a global background color with the exception of one screen. In this case, adjust the background color property on that screen to override the theme.

Her kan du nu se de "Themes" - temaer som du kan have liggende. Normalt er det kun nødvendigt med det som ligger der allerede, men såfremt du vil have flere som kan bruges til forskellige screens kan du blot lave flere.

Et "Theme" er et sæt grundindstillinger, der bruges alle steder hvor den enkelte screen ikke specificerer hvad der skal bruges. Det er også i Themes at man bestemmer om man vil bruge en Splashscreen.

3. Klik på “Default Theme”

Theme for BurgerogCO3

› [Back to Global Themes](#)

Adjust the properties of this theme to change the layout, look and style of this app. These properties are global and will apply to all the plugins in your app. However, not all plugins support all the theme options. It's up to the Plugin Developer to support, or not support these global theme values.

Additional style and layout properties are available for each plugin. Plugin developers determine these additional options. The options in this global theme will not apply if a) A plugin overrides the value. b) The plugin developer did not accommodate for the global setting.

Select a Screen

When you make a selection this window will close.

The list is only showing plugins from the "Splash" category. If you don't see a screen to select, it's because the application does not have a Splash Screen in it's list of screens.

Nickname	Screen / Plugin Type	Modified
Splashscreen	Splash Screen	10/09 05:34 PM
